### 4.5: Proving the Correctness of Grammars

In this section, we consider techniques for proving the correctness of grammars, i.e., for proving that grammars generate the languages we want them to.

### Definition of $\Pi$

Suppose G is a grammar and  $a \in Q_G \cup \text{alphabet } G$ . Then  $\Pi_{G,a} = \{ w \in (\text{alphabet } G)^* \mid w \text{ is parsable from } a \text{ using } G \}.$ 

If it's clear which grammar we are talking about, we often abbreviate  $\Pi_{G,a}$  to  $\Pi_a$ .

Clearly, 
$$\Pi_{G,s_G} = L(G)$$
.

For example, if G is the grammar

$$\mathsf{A} \to \% \mid \mathsf{0A1}$$

then 
$$\Pi_0 = \{0\}$$
,  $\Pi_1 = \{1\}$  and  $\Pi_A = \{0^n 1^n \mid n \in \mathbb{N}\} = L(G)$ .

### Properties of $\Pi$

#### Proposition 4.5.1

Suppose G is a grammar.

- (1) For all  $a \in \text{alphabet } G$ ,  $\Pi_{G,a} = \{a\}$ .
- (2) For all  $q \in Q_G$ , if  $q \to \% \in P_G$ , then  $\% \in \Pi_{G,q}$ .
- (3) For all  $q \in Q_G$ ,  $n \in \mathbb{N} \{0\}$ ,  $a_1, \ldots, a_n \in \mathbf{Sym}$  and  $w_1, \ldots, w_n \in \mathbf{Str}$ , if  $q \to a_1 \cdots a_n \in P_G$  and  $w_1 \in \Pi_{G,a_1}, \ldots, w_n \in \Pi_{G,a_n}$ , then  $w_1 \cdots w_n \in \Pi_{G,q}$ .

### Main Example

Define  $\mathbf{diff} \in \{0,1\}^* \to \mathbb{Z}$  by: for all  $w \in \{0,1\}^*$ ,

**diff** w = the number of 1's in w - the number of 0's in w.

#### Then:

- **diff** % = 0;
- **diff** 1 = 1;
- diff 0 = -1; and
- for all  $x, y \in \{0, 1\}^*$ ,  $\operatorname{diff}(xy) = \operatorname{diff} x + \operatorname{diff} y$ .

### Main Example

Our main example will be the grammar G:

$$\begin{split} \mathsf{A} &\to \% \mid \mathsf{0BA} \mid \mathsf{1CA}, \\ \mathsf{B} &\to \mathsf{1} \mid \mathsf{0BB}, \\ \mathsf{C} &\to \mathsf{0} \mid \mathsf{1CC}. \end{split}$$

Let

$$\begin{split} X &= \{\, w \in \{0,1\}^* \mid \mathbf{diff} \ w = 0 \,\}, \\ Y &= \{\, w \in \{0,1\}^* \mid \mathbf{diff} \ w = 1 \text{ and,} \\ & \text{for all proper prefixes } v \text{ of } w, \mathbf{diff} \ v \leq 0 \,\}, \\ Z &= \{\, w \in \{0,1\}^* \mid \mathbf{diff} \ w = -1 \text{ and,} \\ & \text{for all proper prefixes } v \text{ of } w, \mathbf{diff} \ v \geq 0 \,\}. \end{split}$$

We will prove that  $L(G) = \Pi_{G,A} = X$ ,  $\Pi_{G,B} = Y$  and  $\Pi_{G,C} = Z$ .

### Main Example

#### Lemma 4.5.2

*Suppose* x ∈ {0,1}\*.

- (1) If diff  $x \ge 1$ , then x = yz for some  $y, z \in \{0, 1\}^*$  such that  $y \in Y$  and diff z = diff x 1.
- (2) If diff  $x \le -1$ , then x = yz for some  $y, z \in \{0, 1\}^*$  such that  $y \in Z$  and diff z = diff x + 1.

The proof is in the book.

### Proving that Enough is Generated

First we study techniques for showing that everything we want a grammar to generate is really generated.

Since  $X, Y, Z \subseteq \{0,1\}^*$ , to prove that  $X \subseteq \Pi_{G,A}$ ,  $Y \subseteq \Pi_{G,B}$  and  $Z \subseteq \Pi_{G,C}$ , it will suffice to use strong string induction to show that, for all  $w \in \{0,1\}^*$ :

- (A) if  $w \in X$ , then  $w \in \Pi_{G,A}$ ;
- (B) if  $w \in Y$ , then  $w \in \Pi_{G,B}$ ; and
- (C) if  $w \in Z$ , then  $w \in \Pi_{G,C}$ .

### Enough is Generated in Example

We proceed by strong string induction. Suppose  $w \in \{0,1\}^*$ , and assume the inductive hypothesis: for all  $x \in \{0,1\}^*$ , if x is a proper substring of w, then:

- (A) if  $x \in X$ , then  $x \in \Pi_A$ ;
- (B) if  $x \in Y$ , then  $x \in \Pi_B$ ; and
- (C) if  $x \in Z$ , then  $x \in \Pi_C$ .

We must prove that:

- (A) if  $w \in X$ , then  $w \in \Pi_A$ ;
- (B) if  $w \in Y$ , then  $w \in \Pi_B$ ; and
- (C) if  $w \in Z$ , then  $w \in \Pi_C$ .

### Enough is Generated in Example

- (A) Suppose  $w \in X$ . We must show that  $w \in \Pi_A$ . There are three cases to consider.
  - Suppose w = %. Because  $A \to \% \in P$ , we have that  $w = \% \in \Pi_A$ .
  - Suppose w=0x, for some  $x\in\{0,1\}^*$ . Because  $-1+\operatorname{diff} x=\operatorname{diff} w=0$ , we have that  $\operatorname{diff} x=1$ . Thus, by Lemma 4.5.2(1), we have that x=yz, for some  $y,z\in\{0,1\}^*$  such that  $y\in Y$  and  $\operatorname{diff} z=\operatorname{diff} x-1=1-1=0$ . Thus w=0yz,  $y\in Y$  and  $z\in X$ . We have  $0\in\Pi_0$ . Because  $y\in Y$  and  $z\in X$  are proper substrings of w, parts (B) and (A) of the inductive hypothesis tell us that  $y\in\Pi_B$  and  $z\in\Pi_A$ . Thus, because  $A\to 0BA\in P$ , it follows that that  $w=0yz\in\Pi_A$ .
  - Suppose w = 1x, for some  $x \in \{0, 1\}^*$ . The proof is analogous to the preceding case.

### Enough is Generated in Example

- (B) Suppose  $w \in Y$ . We must show that  $w \in \Pi_B$ . Because diff w = 1, there are two cases to consider.
  - Suppose w=1x, for some  $x \in \{0,1\}^*$ . Because all proper prefixes of w have diffs  $\leq 0$ , we have that x=%, so that w=1. Since  $B \to 1 \in P$ , we have that  $w=1 \in \Pi_B$ .
  - Suppose w = 0x, for some x ∈ {0,1}\*. Thus diff x = 2. Because diff x ≥ 1, by Lemma 4.5.2(1), we have that x = yz, for some y, z ∈ {0,1}\* such that y ∈ Y and diff z = diff x − 1 = 2 − 1 = 1. Hence w = 0yz. To finish the proof that z ∈ Y, suppose v is a proper prefix of z. Thus 0yv is a proper prefix of w. Since w ∈ Y, it follows that diff v = diff(0yv) ≤ 0, as required. Since y, z ∈ Y, part (B) of the inductive hypothesis tell us that y, z ∈ Π<sub>B</sub>. Thus, because B → 0BB ∈ P we have that w = 0yz ∈ Π<sub>B</sub>.
- (C) Suppose  $w \in Z$ . We must show that  $w \in \Pi_C$ . The proof is analogous to the proof of part (B).

#### A Problem with Unit Productions

Suppose H is the grammar

$$A \rightarrow B \mid 0A3$$
,  $B \rightarrow \% \mid 1B2$ ,

and let

$$X = \{ 0^n 1^m 2^m 3^n \mid n, m \in \mathbb{N} \} \text{ and } Y = \{ 1^m 2^m \mid m \in \mathbb{N} \}.$$

We can prove that  $X \subseteq \Pi_{H,A} = L(H)$  and  $Y \subseteq \Pi_{H,B}$  using the above technique, but the production  $A \rightarrow B$ , which is called a *unit* production because its right side is a single variable, makes part (A) tricky. If  $w = 0^0 1^m 2^m 3^0 = 1^m 2^m \in Y$ , we would like to use part (B) of the inductive hypothesis to conclude  $w \in \Pi_B$ , and then use the fact that  $A \to B \in P$  to conclude that  $w \in \Pi_A$ . But w is not a proper substring of itself, and so the inductive hypothesis in not applicable. Instead, we must split into cases m=0 and  $m\geq 1$ , using A  $\rightarrow$  B and B  $\rightarrow$  %, in the first case, and  $A \rightarrow B$  and  $B \rightarrow 1B2$ , as well as the inductive hypothesis on  $1^{m-1}2^{m-1} \in Y$ , in the second case.

#### A Problem with Unit Productions

Because there are no productions from B back to A, we could also first use strong string induction to prove that, for all  $w \in \{0,1\}^*$ ,

(B) if 
$$w \in Y$$
, then  $w \in \Pi_B$ ,

and then use the result of this induction along with strong string induction to prove that for all  $w \in \{0,1\}^*$ ,

(A) if 
$$w \in X$$
, then  $w \in \Pi_A$ .

This works whenever two parts of a grammar are not mutually recursive.

With this grammar, we could also first use mathematical induction to prove that, for all  $m \in \mathbb{N}$ ,  $1^m 2^m \in \Pi_B$ , and then use the result of this induction to prove, by mathematical induction on n, that for all  $n, m \in \mathbb{N}$ ,  $0^n 1^m 2^m 3^n \in \Pi_A$ .

### A Problem with %-Productions

Note that %-productions, i.e., productions of the form  $q \to \%$ , can cause similar problems to those caused by unit productions. E.g., if we have the productions

$$A \rightarrow BC$$
 and  $B \rightarrow \%$ ,

then  $A \rightarrow BC$  behaves like a unit production.

# Proving that Everything Generated is Wanted

To prove that everything generated by a grammar is wanted, we introduce a new induction principle that we call induction on  $\Pi$ .

### Principle of Induction on $\Pi$

### Theorem 4.5.3 (Principle of Induction on □)

Suppose G is a grammar,  $P_q(w)$  is a property of a string  $w \in \Pi_{G,q}$ , for all  $q \in Q_G$ , and  $P_a(w)$ , for  $a \in \text{alphabet } G$ , says "w = a". If

- (1) for all  $q \in Q_G$ , if  $q \to \% \in P_G$ , then  $P_q(\%)$ , and
- (2) for all  $q \in Q_G$ ,  $n \in \mathbb{N} \{0\}$ ,  $a_1, \ldots, a_n \in Q_G \cup \text{alphabet } G$ , and  $w_1 \in \Pi_{G,a_1}, \ldots, w_n \in \Pi_{G,a_n}$ , if  $q \to a_1 \cdots a_n \in P_G$  and  $(\dagger) P_{a_1}(w_1), \ldots, P_{a_n}(w_n)$ , then  $P_q(w_1 \cdots w_n)$ ,

then

for all 
$$q \in Q_G$$
, for all  $w \in \Pi_{G,q}$ ,  $P_q(w)$ .

We refer to (†) as the inductive hypothesis.

### Principle of Induction on $\Pi$

**Proof.** It suffices to show that, for all  $pt \in PT$ , for all  $q \in Q_G$  and  $w \in (alphabet G)^*$ , if pt is valid for G, rootLabel pt = q and yield pt = w, then  $P_q(w)$ . We prove this using the principle of induction on parse trees.  $\square$ 

When proving part (2), we can make use of the fact that, for  $a_i \in \mathbf{alphabet}\ G$ ,  $\Pi_{a_i} = \{a_i\}$ , so that  $w_i \in \Pi_{a_i}$  will be  $a_i$ . Hence it will be unnecessary to assume that  $P_{a_i}(a_i)$ , since this says " $a_i = a_i$ ", and so is always true.

Consider, again, our main example grammar G:

$$\begin{split} \mathsf{A} &\to \% \mid \mathsf{0BA} \mid \mathsf{1CA}, \\ \mathsf{B} &\to \mathsf{1} \mid \mathsf{0BB}, \\ \mathsf{C} &\to \mathsf{0} \mid \mathsf{1CC}. \end{split}$$

Let

$$\begin{split} X &= \{\, w \in \{0,1\}^* \mid \mathbf{diff} \; w = 0 \,\}, \\ Y &= \{\, w \in \{0,1\}^* \mid \mathbf{diff} \; w = 1 \; \text{and,} \\ & \text{for all proper prefixes } v \; \text{of } w, \mathbf{diff} \; v \leq 0 \,\}, \; \text{and} \\ Z &= \{\, w \in \{0,1\}^* \mid \mathbf{diff} \; w = -1 \; \text{and,} \\ & \text{for all proper prefixes } v \; \text{of } w, \mathbf{diff} \; v \geq 0 \,\}. \end{split}$$

We have already proven that  $X\subseteq\Pi_A=L(G),\ Y\subseteq\Pi_B$  and  $Z\subseteq\Pi_C$ . To complete the proof that  $L(G)=\Pi_A=X,\ \Pi_B=Y$  and  $\Pi_C=Z$ , we will use induction on  $\Pi$  to prove that  $\Pi_A\subseteq X,\ \Pi_B\subseteq Y$  and  $\Pi_C\subseteq Z$ .

We use induction on  $\Pi$  to show that:

- (A) for all  $w \in \Pi_A$ ,  $w \in X$ ;
- (B) for all  $w \in \Pi_B$ ,  $w \in Y$ ; and
- (C) for all  $w \in \Pi_C$ ,  $w \in Z$ .

Formally, this means that we let the properties  $P_A(w)$ ,  $P_B(w)$  and  $P_C(w)$  be " $w \in X$ ", " $w \in Y$ " and " $w \in Z$ ", respectively, and then use the induction principle to prove that, for all  $q \in Q_G$ , for all  $w \in \Pi_q$ ,  $P_q(w)$ . But we will actually work more informally.

There are seven productions to consider.

- (A  $\rightarrow$  %) We must show that %  $\in$  X (as " $w \in X$ " is the property of part (A)). And this holds since diff % = 0.
- (A  $\rightarrow$  0BA) Suppose  $w_1 \in \Pi_B$  and  $w_2 \in \Pi_A$  (as 0BA is the right-side of the production, and 0 is in G's alphabet), and assume the inductive hypothesis,  $w_1 \in Y$  (as this is the property of part (B)) and  $w_2 \in X$  (as this is the property of part (A)). We must show that  $0w_1w_2 \in X$ , as the production shows that  $0w_1w_2 \in \Pi_A$ . Because  $w_1 \in Y$  and  $w_2 \in X$ , we have that  $\operatorname{diff} w_1 = 1$  and  $\operatorname{diff} w_2 = 0$ . Thus  $\operatorname{diff}(0w_1w_2) = -1 + 1 + 0 = 0$ , showing that  $0w_1w_2 \in X$ .

- (B ightharpoonup 0BB) Suppose  $w_1, w_2 \in \Pi_B$ , and assume the inductive hypothesis,  $w_1, w_2 \in Y$ . Thus  $w_1$  and  $w_2$  are nonempty. We must show that  $0w_1w_2 \in Y$ . Clearly,  $\operatorname{diff}(0w_1w_2) = -1 + 1 + 1 = 1$ . So, suppose v is a proper prefix of  $0w_1w_2$ . We must show that  $\operatorname{diff} v \leq 0$ . There are three cases to consider.
  - Suppose v = %. Then **diff**  $v = 0 \le 0$ .
  - Suppose v=0u, for a proper prefix u of  $w_1$ . Because  $w_1 \in Y$ , we have that **diff**  $u \le 0$ . Thus **diff** v=-1+ **diff**  $u \le -1+0 \le 0$ .
  - Suppose  $v = 0w_1u$ , for a proper prefix u of  $w_2$ . Because  $w_2 \in Y$ , we have that **diff**  $u \le 0$ . Thus **diff** v = -1 + 1 +**diff** u =**diff** u < 0.
- The remaining productions are handled similarly.
